Main Components of the translator system

- Phrase translator the main topic of this presentation.
 - A well known system: GIZA++
 - Additional postprocessing tools, e.g. in Moses
- Decoder, which can fit better to the phrase dictionary generated by maximum margin learning procedure.

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

The base learning problem of phrase translation

- A phrase implies a binary classification of the words of a sentence;
 - the words within the phrase are the positive cases,
 - the remaining part gives the negative ones.
- The translation can be interpreted as a propagation of the classes of a source sentence into the corresponding target sentence.

(ロ) (同) (三) (三) (三) (三) (○) (○)

It might be interpreted either as an inductive or a transductive learning problem.

The learning schema

class	source words	predicted class	target words
_	Je	?(+,-)	1
_	vous	?(+,-)	would
_	demands	?(+,-)	therefore
_	donc	?(+,-)	once
_	à	?(+,-)	more
_	nouveau	?(+,-)	ask
_	de	?(+,-)	you
_	faire	?(+,-)	to
_	le	?(+,-)	ensure
_	nécessaire	?(+,-)	that
_	pour	?(+,-)	we
+	que	?(+,-)	get
+	nous	?(+,-)	а
+	puissions	?(+,-)	Dutch
+	disposer	?(+,-)	channel
_	ď	?(+,-)	as
_	une	?(+,-)	well
_	chaine

Computational difficulties

- If the sentence length in words is 30 and the maximum length allowed of non-gapped phrases is 5 then 140 binary classification problems have to be solved!
- Does any acceptable efficient joint approximation schema exist at all?

(日) (日) (日) (日) (日) (日) (日)

A learning approach

- The Support Vector Machine(SVM) has proved to be a highly accurate learning tool, but it is able to deal only with binary outputs.
- The learning framework of the SVM can be extended to predict arbitrary vector represented outputs with no additional cost, we will call it Maximum Margin Regression(MMR) in the sequel.
 - The details are discussed when the concrete learning problem is unfolded.
 - MATLAB source code of the solver and a demo for multiclass classification in MMR is freely available on the web.

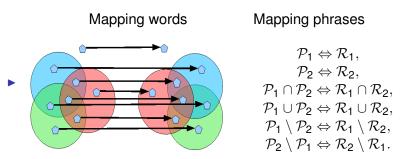

The skeleton of the phrase translation

Sentence-wise word relations, the building blocks:

- global relationships between word pairs,
- local relations,
- inference between global and local relations,

Estimating phrases,
Collect those sequences of source and target words which have the highest accumulated word-wise relations.

A projection rule of the sentences

Intersections mapped into corresponding intersections of the subsets of words those we might consider as phrases. Obviously it can be achieved only approximately!

(日) (日) (日) (日) (日) (日) (日)

Global versus local relations of words

Interference of global and local relations:

- Strong global: Frequent co-occurrences,
- Strong local: adjacent(or almost adjacent) positions

	Globally weak	Globally strong
Locally weak	High confidence	Likely
weak	No relation	No relation
Locally strong	Likely *	High confidence
Ŭ	There is a relation	There is a relation

* case of rare words!

Sentence-wised word distances

Distances:

- The distances measure the co-occurrences of words and their relative positions within the sentences.
 - A co-occurrence with high distance is down scaled.
- Within a language:

$$d_{\mathcal{S}}(w_1, w_2) = \min_{i_1 \in I(w_1), i_2 \in I(w_2)} |\frac{i_1}{n_S} - \frac{i_2}{n_S}|$$

Between two languages:

$$d_{\mathcal{S}_{s},\mathcal{S}_{t}}(w_{1},w_{2}) = \min_{i_{1} \in I(w_{1}), i_{2} \in I(w_{2})} |\frac{i_{1}}{n_{S_{s}}} - \frac{i_{2}}{n_{S_{t}}}|$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

Sentence-wised word similarities

Similarities:

► Linear:

$$s_{\mathcal{S}}(w_1, w_2) = 1 - d_{\mathcal{S}}(w_1, w_2) s_{\mathcal{S}_s, \mathcal{S}_t}(w_1, w_2) = 1 - d_{\mathcal{S}_s, \mathcal{S}_t}(w_1, w_2)$$

Gaussian:

$$s_{\mathcal{S}}(w_1, w_2) = e^{\left(-\frac{d_{\mathcal{S}}^2(w_1, w_2)}{\sigma}\right)}$$
$$s_{\mathcal{S}_s, \mathcal{S}_t}(w_1, w_2) = e^{\left(-\frac{d_{\mathcal{S}_s, \mathcal{S}_t}^2(w_1, w_2)}{\sigma}\right)}$$

Logistic:

$$\begin{split} s_{\mathcal{S}}(\textbf{w}_1, \textbf{w}_2) &= \frac{1}{4s} \texttt{sech}^2 \left(\frac{d_{\mathcal{S}}(\textbf{w}_1, \textbf{w}_2)}{2s} \right) \\ s_{\mathcal{S}_s, \mathcal{S}_t}(\textbf{w}_1, \textbf{w}_2) &= \frac{1}{4s} \texttt{sech}^2 \left(\frac{d_{\mathcal{S}_s, \mathcal{S}_t}(\textbf{w}_1, \textbf{w}_2)}{2s} \right) \\ \texttt{sech}(z) &= \frac{1}{\cosh(z)} = \frac{2}{e^z + e^{-z}} \end{split}$$

◆□▶ ◆□▶ ◆豆▶ ◆豆▶ □豆 の々で

Global(training set relative) similarity

Within a language:

$$s(w_1, w_2) = \frac{\sum_{\mathcal{S} \in \mathcal{S}(w_1) \cap \mathcal{S}(w_2)} s_{\mathcal{S}}(w_1, w_2)}{|\mathcal{S}(w_1) \cup \mathcal{S}(w_2)|}$$

Between two languages:

$$s(w_1, w_2) = \frac{\sum_{S \in \mathcal{S}_s(w_1) \cap \mathcal{S}_t(w_2)} s_{\mathcal{S}_s, \mathcal{S}_t}(w_1, w_2)}{|\mathcal{S}(w_1)_s \cup \mathcal{S}_t(w_2)|}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

S(w) is the index set of the sentences containing word w in the training set.

Word features, local relations

Word features with respect to a sentence pair(source-target) expressed as a concatenated vector of the similarities between the word and the words of the source and the target sentences.

Source words:

$$\phi_{\mathcal{S}_{s},\mathcal{S}_{t}}(w_{s}) = \underbrace{\underbrace{(s(w_{s}, w_{s_{1}}), \dots, s(w_{s}, w_{s_{n_{\mathcal{S}_{s}}}})}_{(w_{s_{1}}, \dots, w_{s_{n_{\mathcal{S}_{s}}}}) = \mathcal{S}_{s}}}, \underbrace{\underbrace{(w_{s}, w_{t_{1}}), \dots, s(w_{s}, w_{t_{n_{\mathcal{S}_{t}}}})}_{(w_{t_{1}}, \dots, w_{t_{n_{\mathcal{S}_{t}}}}) = \mathcal{S}_{t}}}$$

Target words:

$$\phi_{\mathcal{S}_{s},\mathcal{S}_{t}}(w_{t}) = \underbrace{\underbrace{(\mathbf{s}(w_{t}, w_{s_{1}}), \dots, \mathbf{s}(w_{t}, w_{s_{n_{\mathcal{S}_{s}}}})}_{(w_{s_{1}}, \dots, w_{s_{n_{\mathcal{S}_{s}}}})=\mathcal{S}_{s}}}, \underbrace{\mathbf{s}(w_{t}, w_{t_{1}}), \dots, \mathbf{s}(w_{t}, w_{t_{n_{\mathcal{S}_{t}}}})}_{(w_{t_{1}}, \dots, w_{t_{n_{\mathcal{S}_{t}}}})=\mathcal{S}_{t}})}$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Feature = Language model + Translation model

$$\phi_{\mathcal{S}_{s},\mathcal{S}_{t}}(\mathcal{S}_{s},\mathcal{S}_{t}) = \begin{bmatrix} SS & ST \\ TS & TT \end{bmatrix},$$

- SS relationship between source items,
- TT relationship between target items,
- ST(TS) relationship between source and target items.

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

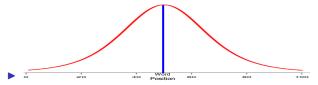

Word positions

- The position feature of a word should express the uncertainty arising from the varying grammatical relations.
- This uncertainty can be captured by a probability density function with an expected value localized in the real position of the word in a given concrete sentence.

・ コット (雪) (小田) (コット 日)

•
$$\psi_{\mathcal{S}}(w) = f(.|i_w, \Theta)$$
, where

- f a suitable density function, e.g. Gaussian
- i_w is the position of the word in sentence S,
- \triangleright Θ a scale parameter, e.g. variance,

Learning problem

- The densities are the representation of the assumed to be correct positions are inferred with features as representation of the relations of the words.
- ► We predict:

word relations ↑

expected position of the words within a sentence

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

Optimization problem

 Optimization framework, Maximum Margin Regression(MMR):

$$\begin{array}{ll} \min & \frac{1}{2} \|\mathbf{W}\|_{\textit{Frobenius}}^2 + C \sum_{s=1}^{n_{\mathcal{S}_s}} \xi_s \\ \text{w.r.t.} & \mathbf{W} \text{ linear operator}, \boldsymbol{\xi} \text{ loss,} \\ \text{s.t.} & \langle \underbrace{\boldsymbol{\psi}_{\mathcal{S}_s}(w_s)}_{\text{possible word position}}, \mathbf{W} \underbrace{\boldsymbol{\phi}_{\mathcal{S}_s,\mathcal{S}_t}(w_s)}_{\text{word relations}} \rangle \geq 1 - \xi_s, \ w_s \in \mathcal{S}_s, \\ \boldsymbol{\xi} \geq \mathbf{0}, \end{array}$$

The optimum has the form:

$$\mathbf{W} = \sum_{\mathbf{w}_{s} \in \mathcal{S}_{s}} lpha_{\mathbf{w}_{s}} \psi_{\mathcal{S}_{s}}(\mathbf{w}_{s}) \phi_{\mathcal{S}_{s},\mathcal{S}_{t}}(\mathbf{w}_{s})',$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

High level, margin based word similarity measure

Sentence relative similarity predicted between all pairs of source and target words:

$$\begin{array}{l} \text{source} \Rightarrow \text{target} \\ \widehat{\mathscr{R}}_{\mathbf{W}}(\mathbf{w}_{s}, \mathbf{w}_{t}) &= \langle \psi_{\mathcal{S}_{s}}(\mathbf{w}_{s}), \mathbf{W} \phi_{\mathcal{S}_{s}, \mathcal{S}_{t}}(\mathbf{w}_{t}) \rangle \\ &= \sum_{\mathbf{w}_{r} \in \mathcal{S}_{s}} \alpha_{\mathbf{w}_{r}} \kappa_{\psi}(\mathbf{w}_{s}, \mathbf{w}_{r}) \kappa_{\phi}(\mathbf{w}_{r}, \mathbf{w}_{t}) \end{array}$$

and

$$\begin{aligned} & \text{target} \Rightarrow \text{source} \\ \widehat{\mathscr{R}'_{\mathbf{W}}}(\mathbf{w}_t, \mathbf{w}_s) &= \langle \mathbf{W}' \psi_{\mathcal{S}_s}(\mathbf{w}_s), \phi_{\mathcal{S}_s, \mathcal{S}_t}(\mathbf{w}_t) \rangle \\ &= \sum_{\mathbf{w}_r \in \mathcal{S}_s} \alpha_{\mathbf{w}_r} \kappa_{\psi}(\mathbf{w}_s, \mathbf{w}_r) \kappa_{\phi}(\mathbf{w}_r, \mathbf{w}_t) \end{aligned}$$

where

$$\kappa_{\psi}(\mathbf{w}_{s},\mathbf{w}_{r}) = \langle \psi_{\mathcal{S}_{s}}(\mathbf{w}_{s}), \psi_{\mathcal{S}_{s}}(\mathbf{w}_{r}) \rangle$$

$$\kappa_{\phi}(\mathbf{w}_{r},\mathbf{w}_{t}) = \langle \phi_{\mathcal{S}_{s},\mathcal{S}_{t}}(\mathbf{w}_{r}), \phi_{\mathcal{S}_{s},\mathcal{S}_{t}}(\mathbf{w}_{t}) \rangle.$$

Word alignment

A source word is aligned to those target words which maximizes the relations, and a target word is aligned to those source words which maximizes the relations

$$\begin{array}{ll} w_s \Leftrightarrow w_t & \hat{w}_s(w_t) \in \arg\max_{w \in \mathcal{S}_s} \mathscr{R}_{\mathbf{W}}(w, w_t), \\ w_t \Leftrightarrow w_s & \hat{w}_s(w_s) \in \arg\max_{w \in \mathcal{S}_t} \mathscr{R}'_{\mathbf{W}}(w, w_s). \end{array}$$

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

The words can be aligned to more than one words in ambiguous cases!

Alignment of four views

 W computed on the source words only and the target labels are predicted

$$\begin{array}{ll} w_{s} \Leftrightarrow w_{t} & \hat{w}_{s}(w_{t}) \in \arg\max_{w \in \mathcal{S}_{s}} \mathscr{R}_{\mathbf{W}_{s}}(w, w_{t}), \\ w_{t} \Leftrightarrow w_{s} & \hat{w}_{s}(w_{s}) \in \arg\max_{w \in \mathcal{S}_{t}} \mathscr{R}'_{\mathbf{W}_{s}}(w, w_{s}). \end{array}$$

 W computed on the target words only and the source labels are predicted

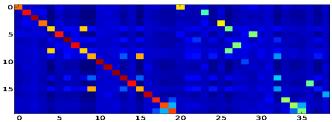

$$\begin{array}{l} w_{s} \Leftrightarrow w_{t} \quad \hat{w}_{s}(w_{t}) \in \arg\max_{w \in \mathcal{S}_{s}} \mathscr{R}_{\mathbf{W}_{t}}(w,w_{t}), \\ w_{t} \Leftrightarrow w_{s} \quad \hat{w}_{s}(w_{s}) \in \arg\max_{w \in \mathcal{S}_{t}} \mathscr{R}'_{\mathbf{W}_{t}}(w,w_{s}). \end{array}$$

néerlandaise	e18		

Phrase prediction

- Collect the target words most relating to the words of a given source phrase,
- A target word has edges going into this source phrase and into its complement with respect to the sentence.
- Consider the former as positive edges and the latter ones as negative ones.
- If the sum of scores on the positive edges greater than on the negatives then the word belongs to the translation of the source phrase. Where the score is equal to

$$\mathscr{R}_{\mathsf{W}}(\mathsf{w}_{s},\mathsf{w}_{t}) = \langle \psi_{\mathcal{P}_{\mathcal{S}_{s}}}(\mathsf{w}_{s}), \mathsf{W}\phi_{\mathcal{S}_{s},\mathcal{S}_{t}}(\mathsf{w}_{t}) \rangle$$

- The gapes can be allowed or prohibited in both side. No gap dependency!
- Phrase score is just the sum of the scores of the words within in the current implementation.

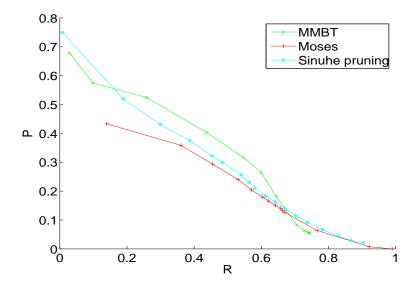

Offline versus online, parallel processing

- The update of the phrase table works in online fashion, all new sentences are processed incrementaly.
- Computation of the features, optimization, phrase prediction can be evaluated parallel in a multiprocesor system.

MMBT versus GIZA

Tuning Recall and Precision

◆□> ◆□> ◆豆> ◆豆> ・豆 ・ 釣べ⊙

Current state

- On a desktop machine, CPU: Intel 2.1GHz, ~5 sentences per second can be trained assuming the average length of the Europarl sentences.
- The memory requirement is ~ 8GB at a
 1 million sentence training corpus, which can be reduced to half on the expense of the speed.
- Accuracies with the decoder to be developed parallel, which currently translates 50 sentences/ second if the phrase dictionary stored in a memory disk:

Languages	Bleu	Nist	Training size/Test size
French-English	0.2642	7.6713	1.3million/10000

The prototype is written in pure Python code.

This is the End ...

Thanks!
